MANGANA, PRINCE ADRIAN M. CPE-008

CPE11S4

1. **Do you think an engineer should also be good in written communication? Why? Explain and justify your thoughts.**

   Yes, I think an engineer should be good at written communication because engineers need to explain their ideas and work clearly. They may need to make reports, write emails, instructions, and other documents. If an engineer cannot communicate properly through writing, other people might misunderstand the information. For me, good writing is important because engineering is not only about solving problems but also about explaining solutions to others.

2. **How would you differentiate oral communication from engineering graphical communication?**

   Oral communication is when we use spoken words to share information, ideas, or instructions with other people. Engineering graphical communication uses drawings, diagrams, symbols, and other visuals to show technical information. Oral communication is commonly used during meetings, discussions, and presentations, while graphical communication is useful for showing designs and how something should be built. Both are important because they help engineers communicate their ideas in different ways.

3. **As a future engineer, how would you justify the popular phrase "Communication is the key" in workplace?**

   As a future engineer, I believe that communication is the key because engineers need to work with different people. Good communication helps team members understand their tasks, share their ideas, and solve problems together. It can also prevent misunderstandings and mistakes that could affect a project. That is why I think having good communication skills is just as important as having technical skills in the workplace.
